

## DFA's, NFA's, Reg. Exprs.

This Finite Automaton accepts strings (over  $\Sigma = \{a, b\}$ ) with # a's divisible by 3.

Finite Automata

- Deterministic (DFA)
- Non-deterministic (NFA)

e.g. (NFA w/ Contradictory Trans.)

e.g. (NFA w/  $\epsilon$ -trans.)

defn a DFA is a 5-tuple  $(Q, \Sigma, \delta, q_0, F)$  where

- $Q$  is a finite set of states
- $\Sigma$  is a finite set of symbols (alphabet)
- $\delta: Q \times \Sigma \rightarrow Q$  is a transition function
- $q_0 \in Q$  is the start state
- $F \subseteq Q$  is the set of final states.

defn An NFA is exactly the same except...

- $\delta: Q \times (\Sigma \cup \{\epsilon\}) \rightarrow \mathcal{P}(Q)$ .

is the non-det. trans. function

e.g. Write an NFA that accepts strings where the 4<sup>th</sup> to last character is an  $a$  (where  $\Sigma = \{a, b\}$ ).

Question: Can we write a DFA for this?

yes...

thm (Kleene's).

Reg. Exp. are equivalent to NFAs which are equivalent to DFAs.

alg. (Thompson).

Reg Exp.	NFA
$\epsilon$	$\rightarrow \odot$
$a \in \Sigma$	$\rightarrow \bigcirc \xrightarrow{a} \odot$
$R_1 R_2$	$\rightarrow \boxed{R_1} \xrightarrow{\epsilon} \boxed{R_2}$
$R_1   R_2$	$\rightarrow \bigcirc \begin{array}{l} \xrightarrow{\epsilon} \boxed{R_1} \xrightarrow{\epsilon} \odot \\ \xrightarrow{\epsilon} \boxed{R_2} \xrightarrow{\epsilon} \odot \end{array}$
$R^*$	$\rightarrow \bigcirc \xrightarrow{\epsilon} \boxed{R} \xrightarrow{\epsilon} \odot \xrightarrow{\epsilon} \bigcirc \xrightarrow{\epsilon} \boxed{R} \xrightarrow{\epsilon} \odot$

e.g. (Subset)

subset
